# BACKCOUNTRY BLEND BOOST

 DRY FERTILIZER  ADDITIVE NUTRIENT  FLOWERING STAGE

## WHAT IT IS

Backcountry Blend Boost is a controlled release granular bloom additive. It can easily be applied to soil to provide your plants with a boost of PK during the flowering stage. Part of the Backcountry Blend Outdoor Feeding Program

## HOW IT WORKS

Backcountry Blend Boost is designed to be used in conjunction with Backcountry Blend Bloom. Boost provides your outdoor plants with an extra dosage of phosphorus (P), potassium (K), and calcium (Ca), as well as an addition of humic acid. Phosphorus and potassium are vital elements that aid in the development of flowers and movement of nutrients through the plant during the flowering stage. Calcium plays a major role in cell wall composition and also helps maintain chemical balances in the soil. Humic acid aids in the movement of nutrients through the grow medium, making them easier for the plant to absorb. These added benefits improve overall yields, floral development, colour, and aroma. This formula is designed to be top dressed 3-4 weeks into the flowering stage.

## HOW TO USE IT

We recommend an application rate of 1 cup (0.5 lbs) per 100 square feet every 3 weeks. For smaller sized containers, use 1 tsp per 2 gallons of soil or approximately 1 tbsp for every 2 feet of plant height. For incorporating the product into the soil, apply 1 lb per 10 cubic feet. This is a generalized feeding rate and may be adjusted based on your particular flowering needs.

## FOR USE IN

OUTDOORS

SOIL / SOILLESS
