Understanding the Feed Program: Backcountry Blend Outdoor Feed program

Topics Covered:

- What is a feed program?
- The "parts" of the Backcountry Blend feed program
- Feeding tips and considerations

Perhaps the simplest, yet most effective fertilizer on the market, the BackCountry Blend (BCB) feed program provides steady nutrition throughout periods of vegetative, flowering and ripening growth, all while being one of the most affordable nutrient systems available to growers today. Originally formulated for the outdoor and greenhouse garden, BCB has quickly become a favorite for new and experienced growers in a variety of systems with specialized growing practices and routines.

By combining growing, blooming, and quality-enhancing inputs into a feed program, growers can expect to produce heavy flowers and large, tasty fruits, harvest after harvest. To browse a complete list of feed programs available at GreenPlanet Nutrients, click here. Or, read the blog below for more information on the BackCountry Blend feed program.

Save Time, Money, and Labour with Backcountry Blend

Topics Covered:

- What is Backcountry Blend
- How BCB Saves Time, Money, and Labor
- Using Backcountry Blend

We designed the BackCountry Blend (BCB) feeding program as an economic choice for gardeners who want to spend less, save time and expend less labour in the process of getting the same reliable results. The outdoor season can be long, and over the course of months, gardeners using traditional liquid fertilizers can anticipate spending thousands of dollars on a complete feeding program. With BackCountry Blend, however, gardeners can expect to spend far less over the course of a season, while also saving time and labour in applying BCB, as no mixing, measuring or buffering is ever required. This year, we've detailed these benefits of BackCountry Blend in several blogs. Read the following passages for a summary of the money, time and labour savings of BackCountry Blend.
